

## ABSTRACT

A configurable safe module for storing firearms is provided. The configurable safe module includes a bracket and at least one barrel receiving module. The bracket is adapted to be positioned on an interior surface of the safe. The barrel receiving module has at least one barrel receiving cradle for receiving a barrel of a gun and a clip for movably mounting the barrel receiving module to the bracket. The configurable safe module may also include an extension member to further separate a gun placed in the receiving module from an interior wall of a storage compartment.
